5.8 实战项目 爬取京东商城网站数据

任务:

京东商城有大量的商品数据,在搜索框中输入某类商品,例如"手机",就可以看到近百页手机的信息。现在我们使用 Selenium 编写一个爬虫程序,自动在输入框输入"手机",自动翻页爬取所有手机的数据与图像,并保存到数据库。

5.8.1 解析网页 HTML 代码

京东网站有很多各种各样的手机,用 chrome 浏览器进入京东网站输入"手机",那么就会看到如图 5-8-1 所示的画面。

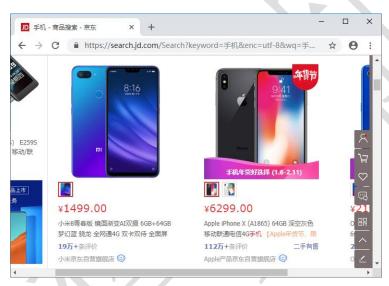

图 5-8-1 京东商城网站

右键点击第一个手机弹出菜单,选择"检查"可以看到每一个手机的信息是包含在一组 的元素中的,再仔细分析这些都包含在一个<div id="J_goodsList">中,而且每个的形式都是,因此分析中的结构就可以找到手机的各种信息,如图 5-8-2 所示。

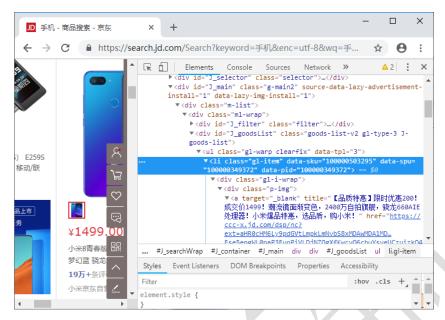

图 5-8-2 网站 HTML 代码

复制出其中一个的代码如下:

src="//misc.360buyimg.com/lib/img/e/blank.gif" style="display: none;"/>
       </div>
```

5.8.2 爬取网页数据

1、爬取手机元素

从 HTML 中可以看到 每个都包含在<div id="J_goodsList">下面的,而且每个都是li class="gl-item">的格式,因此使用:

lis = self.driver.find_elements_by_xpath("//div[@id='J_goodsList']//li[@class='gl-item']") for li in lis:

从 |i 爬取数据

在循环可以得到每个元素,每部手机的数据从 li 对象中进一步爬取。

2、爬取价格

价格存在于<div class='p-price'>下面的一个<i>元素下,因此 price 价格这样爬取:trv:

```
price = li.find_element_by_xpath(".//div[@class='p-price']//i").text
except:
    price = "0"
```

3、爬取品牌与简介

品牌与简介存在于<div class='p-name p-name-type-2'>下面的元素中,而且品牌时这个下面文字中的第一个部分(用空格分开),因此品牌 mark 与简介 note 如下:

try:

```
note = li.find_element_by_xpath(".//div[@class='p-name p-name-type-2']//em").text
mark = note.split(" ")[0]
mark = mark.replace("爱心东东\n", "")
mark = mark.replace(",", "")
note = note.replace("爱心东东\n", "")
note = note.replace(",", "")
except:
note = ""
mark = ""
```

4、爬取图像地址

仔细分析 HTML 代码可以看到手机图像存在于<div class="p-img">下面的一个<a>超级链接的元素中,图像要么存储于的 src 属性,要存储在的 data-lazy-img 属性,因此我们在这个两个属性中去取两个地址 src1 与 src2,程序如下:

```
try:
```

```
src1 = li.find_element_by_xpath(".//div[@class='p-img']//a//img").get_attribute("src")
except:
    src1=""
try:
    src2 = li.find_element_by_xpath(".//div[@class='p-img']//a//img").get_attribute("data-lazy-img")
    except:
```

```
src2=""
地址 src1 与 src2 中一般总有一个有图像存在,编写 download 下载函数如下:
def download(self, src1, src2, mFile):
    data = None
    if src1:
         try:
              req = urllib.request.Request(src1, headers=MySpider.headers)
             resp = urllib.request.urlopen(req, timeout=400)
              data = resp.read()
         except:
             pass
    if not data and src2:
         try:
              reg = urllib.reguest.Reguest(src2, headers=MySpider.headers)
             resp = urllib.request.urlopen(req, timeout=400)
              data = resp.read()
         except:
              pass
    if data:
         fobj = open(MySpider.imagePath + "\\" + mFile, "wb")
         fobj.write(data)
         fobj.close()
         print("download", mFile)
```

如果 src1 存在 download 试图先从 src1 下载,如果下载成功就完成,如果 src1 不存在或者下载失败就从 src2 下载,一般情况下总有一个地址可以下载。

5.8.3 实现网页翻页

手机很多,有很多个网页,找到网页的翻页控制,发现翻页不是通过简单的 HTML 代码控制的,而是通过 JavaScript 控制的,如图 5-8-3 所示。

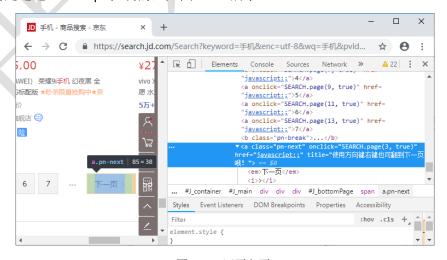

图 5-8-3 网页翻页

由此可见要爬取下一个页面的手机就必须获取控制翻页的超级链接元素<a>,并模仿鼠

```
复制出翻页的 HTML 如下:
      <span class="p-num">
        <a class="pn-prev disabled">
         <i>
          <
         </i>
         <em>
          上一页
         </em>
        </a>
        <a class="curr" href="javascript:;">
         1
        </a>
        <a href="javascript:;" onclick="SEARCH.page(3, true)">
         2
        </a>
        <a href="javascript:;" onclick="SEARCH.page(5, true)">
        3
        </a>
        <a href="javascript:;" onclick="SEARCH.page(7, true)">
         4
        </a>
        <a href="javascript:;" onclick="SEARCH.page(9, true)">
         5
        </a>
        <a href="javascript:;" onclick="SEARCH.page(11, true)">
        6
        </a>
        <a href="javascript:;" onclick="SEARCH.page(13, true)">
        </a>
        <b class="pn-break">
        </b>
        <a class="pn-next" href="javascript:;" onclick="SEARCH.page(3, true)" title="使用方向键
右键也可翻到下一页哦!">
         <em>
          下一页
         </em>
         <i>
          >
         </i>
        </a>
```

标点击那样去点击该链接,这样就转去下一个页面了。

```
</span>
```

从中看只要找到,然后找到"下一页"的超级链接,在正常能翻页时超级链接是,到最后一页不能翻页时变成,因此编写下列程序找到 nextPage 就能实现翻页:

try:

self.driver.find_element_by_xpath("//span[@class='p-num']//a[@class='pn-next
disabled']")

except:

nextPage = self.driver.find_element_by_xpath("//span[@class='p-num']//a[@class='pn-next']")

nextPage.click()

如果没有找到元素就找元素,然后使用nextPage.click()实现翻页。

5.8.4 编写爬虫程序

```
根据前面的分析,编写爬虫程序如下:
```

from selenium import webdriver

from selenium.webdriver.chrome.options import Options

import urllib.request

import threading

import sqlite3

import os

import datetime

from selenium.webdriver.common.keys import Keys

import time

```
class MySpider:
```

```
headers = {
```

"User-Agent": "Mozilla/5.0 (Windows; U; Windows NT 6.0 x64; en-US; rv:1.9pre) Gecko/2008072421 Minefield/3.0.2pre"}

imagePath = "download"

def startUp(self,url,key):

```
# Initializing Chrome browser
```

chrome_options = Options()

chrome_options.add_argument('--headless')

chrome options.add argument('--disable-gpu')

self.driver = webdriver.Chrome(chrome_options=chrome_options)

Initializing variables

self.threads = []

self.No = 0

self.imgNo=0

```
# Initializing database
              try:
                   self.con = sqlite3.connect("phones.db")
                   self.cursor = self.con.cursor()
                   try:
                        # 如果有表就删除
                        self.cursor.execute("drop table phones")
                   except:
                        pass
                   try:
                        # 建立新的表
                        sql = "create table phones (mNo varchar(32) primary key,mMark
varchar(256),mPrice varchar(32),mNote varchar(1024),mFile varchar(256))"
                        self.cursor.execute(sql)
                   except:
                        pass
              except Exception as err:
                   print(err)
              # Initializing images folder
              try:
                   if not os.path.exists(MySpider.imagePath):

elif s=="3":

break

startUp 函数中初始化数据库 phones.db 并建立一张空的 phones 表以备存储数据,同时 创建 download 文件夹并清空文件夹的文件,准备存储下载的图像。函数中还查找到网页的 输入框<input id="key">并模拟键盘输入要爬取的商品关键字 key,并模拟键盘回车转去商品的网页,关键程序如下:

keyInput=self.driver.find_element_by_id("key")
keyInput.send_keys(key)
keyInput.send keys(Keys.ENTER)

5.8.5 执行爬虫程序

执行这个爬虫程序, 耗时 921 秒, 结果总共爬取到近 100 个页面的近 6000 部手机的数据与图像, 下面是部分结果:

Spider starting.....
